Installation Guide

Download and install WAMP 32 bit from the link <http://www.wampserver.com/en/>. Do not change any of the default settings. After the installation is complete, start the WAMP Server from the Start menu. You can see the icon go green in the icon tray.

Now if you type localhost in the browser you will get a configuration page. Click on the phpMyAdmin link. Run the code attached in file "test.sql" in the SQL tab to create the DB for the System.

Now place the wordpress files attached in the "www" folder of WAMP. Create a User and database and integrate the wordpress.

Run the WordPress installation script by accessing the URL localhost/wordpress/wp-admin/install.php in a web browser. WordPress should now be installed.

The main page of the site can be accessed by localhost/wordpress/carpool.
